# ELECTRIFICATION SOLUTIONS BASED ON AUTOMOTIVE PROCESSORS AND MICROCONTROLLERS

The automotive industry is adapting itself to the new vehicle electrification trends by using renewable sources of energy. Both customer preferences for an eco-friendly lifestyle and government regulations around the globe are driving the growth in electrification systems.

Carmakers understand the need to provide a range of electric vehicle (EV) alternatives to ease the transition from internal combustion vehicles to fully electric. Most carmaker fleets offer progressively electrified vehicle options that cover both customer and government requirements. However, the automotive industry at large is working hard to overcome the hurdle of providing this range of different EV types with varying architectures within small delivery windows.

The automotive industry divided the architectures of new electric and hybrid vehicles (HEVs/EVs) types into 5 different categories: from the basic mild hybrid (M-HEV), full hybrid (F-HEV), and plugin-hybrid (P-HEV), up to the range-extended EV (RE-BEV), and fully electric vehicles (BEV). Each of these architectures has specific power needs. They also need dedicated hardware and software development for the specific systems; reusing hardware and software development across different architectures is

helping automakers with the challenges that the market is demanding around costs and time.

NXP delivers electrified system solutions, incorporating optimal performance, robust functional safety, and power management features that automakers and developers require for their next generation of vehicles. We offer a robust, scalable portfolio of functional safety MCUs with associated power management ICs and SBCs, together with in-vehicle networking components for CAN, LIN, FlexRay™, and Ethernet.

Our development platforms and comprehensive software offerings (partnered with MathWorks) plus worldwide automotive presence and support for engineers can help you develop the next HEV generation. Our broad range of fully qualified solutions helps improve fuel economy and enhance performance.

## **BATTERY MANAGEMENT SYSTEM (BMS)**

Our products for industrial or automotive applications offer high measurement accuracy and ISO 26262 support up to ASIL D functional safety capability.

## **HYBRID ELECTRIC VEHICLE (HEV)**

We developed a portfolio that provides the building blocks for all the different electric vehicle types, addressing the need for cleaner cars and lower emissions.

## **ELECTRIC VEHICLE (EV) POWER INVERTER**

Our products target traction motor and onboard charging (OBC) applications.

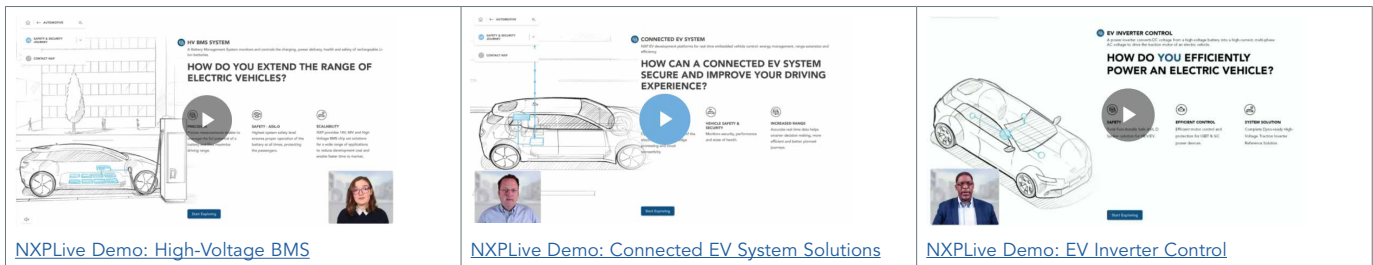

BMS	HEV Engine	Power Inverter
 <p><a href="#">RDVCU5775EVM</a> high-voltage BMS and Vehicle Control Unit (VCU) reference design, featuring <a href="#">MPC5775B-E</a></p>	 <p><a href="#">GreenBox 3</a> To begin development on NXP's next generation of HEV and internal combustion engine MCUs, featuring <a href="#">S32Z</a> and <a href="#">S32E Real-Time Processors</a></p>	 <p><a href="#">EV-INVERTERHDBT</a> power inverter control (ICP 2.0) reference design for electric vehicle high-voltage traction inverters, using IGBT power modules, featuring <a href="#">MPC5775B-E</a></p>
 <p><a href="#">MPC5775B/E-EVB</a> development board for BMS and inverter</p>	 <p><a href="#">MPC5777C-DEVB</a> development board</p>	 <p><a href="#">EV-INVERTER</a> power inverter control reference design for electric vehicle traction motors and DC to DC converters, featuring <a href="#">MPC5775B-E</a></p>
 <p><a href="#">MPC5775B-BatterySystem</a> high-voltage evaluation system</p>	 <p><a href="#">MPC5777MEVB</a> Evaluation system</p>	
 <p><a href="#">NEWTEC-NTBMS</a> e-mobility BMS solution targeting ASIL C functional safety, featuring <a href="#">S32K1 MCUs</a></p>	 <p><a href="#">MPC5775BE-EVB</a> evaluation system</p>	
 <p><a href="#">RDDRONE-BMS772</a> 3 to 6 cell BMS on mobile robotics (drones and rovers) reference design, featuring <a href="#">S32K1</a></p>	 <p><a href="#">MPC5777CEVB</a> Evaluation System</p>	
 <p><a href="#">RD-K344BMU</a> high-voltage Battery Management Unit (BMU) reference design, featuring <a href="#">S32K3</a></p>	 <p><a href="#">MPC5746REVB</a> Evaluation System</p>	
 <p><a href="#">RD33771-48VEVM</a> 48 V BMS reference design, featuring <a href="#">MPC574xP</a></p>		

**Model-Based Design Toolbox (MBDT) software**

Estimating battery state of charge (SoC) is difficult and complex because of the non-linear character of the batteries and the internal environment assessments. Neural Networks and NXP's [MBDT](#) helps simplify the development of a battery SoC estimation algorithm for BMS
